Peptide and Protein Summary

- All spectra were searched against a protein sequence database, Mouse Uniprot (2021), with forward / reverse sequences and common contaminants. Phosphorylation was included as a variable modification. Resulting phosphopeptide assignments were filtered utilizing the target-decoy approach via a linear discriminant analysis that weights several features
- Peptides and proteins were filtered to a 1% false discovery rate (FDR)
- Peptides were assembled into collapsed protein groups via the rules of parsimony
- Phosphopeptides were further filtered for quantitative robustness by requiring a minimum of 360 signal / noise (SN) and an Isolation Purity greater than 50%
- Phosphopeptides are reduced to sites based on localization according to a binomial probability

Total Quantified Phosphopeptides	Total Unique Quantified Phosphopeptides	Total Quantified Sites	Total Quantified Collapsed Phosphoproteins
